

RECYCLER

Bringing you the industry's best, most productive work day your water and sewer operations have ever experienced

FEATURES

- 73% or higher reduction in freshwater usage depending on conditions
- Increased production and better line cleaning without stopping to refill water

WHY A VAC-CON RECYCLER

Versatile with full functionality of standard combination machine with the ability to recycle water when jetting.

All components are designed for recycled water use - no fast moving water pumps or components repurposed from fresh water system.

Coarser filtration allows for a greater range of operating conditions such as heavily sedimented and small or large diameter lines. Ability to use any water source including lift stations.

Simple operator valves and controls. Only CANbus control over water system is RPM and water pressure presets.

Debris tank holds recycled water without any settling tanks or side-mounted gray water tanks to fill - no waiting to refill supply. Once the unit is filled to 60-70%, your water supply is full.

Water, circuits, and water bypass valves are manual, reducing failure points - the system doesn't rely on any air actuators, pneumatic valves or programming to operate.
